TESSON Reading Strategies

7-6 Use a Graphic Organizer

Definition

The number *e* is an irrational constant like π . You can estimate e by using very large values of *n* in the formula.

$$f(n) = \left(1 + \frac{1}{n}\right)^n$$

$$\approx 2.7182818...$$

 $e \approx 2.7182818...$

Example (compound interest)

For a **principal** investment of \$100 with a growth rate of 5% for 10 years compounded continuously, the total amount will be:

$$A = Pe^{rt}$$

= 100 • $e^{0.05 \times 10}$
= \$164.87

Facts

A logarithm with base e is called a natural logarithm ($\ln x$).

The functions e^x and $\ln x$ have the same properties as the other exponential and logarithmic functions you have studied.

Useful Hints

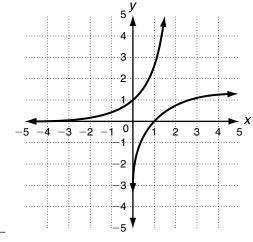

You can use the property of inverse functions to solve many problems containing e and In.

For example:

In
$$e^3 = 3$$
 and $e^{\ln 3} = 3$

Answer each question.

- **1. a.** Rewrite $e^{3 \ln x}$ using the Power Property of logarithms.
 - **b.** Now simplify.
- **2.** The graph shows $g(x) = e^x$ and $g^{-1}(x) = \ln x$.
 - **a.** Label each curve with the correct function.
 - **b.** What transformation is represented by the 2 curves?
 - **c.** Explain how you can tell that they are inverse functions.

- **3.** $A = Pe^{rt}$ is a formula used for continuously compounded interest.
 - a. Which variable represents the principal or starting amount?
 - b. Which variable represents the time length of the investment?
 - **c.** Which variable represents the rate of interest paid on the investment? _

on Reteach

7-5 The Natural Base, e (continued)

The natural base, e, appears in the formula for interest compounded continuously.

A = total amount

P = principal, or initial amount

r = annual interest rate

t = time in years

What is the total amount for an investment of \$2000 invested at 3% and compounded continuously for 5 years?

Step 1 Identify the values that correspond to the variables in the formula.

r = 3% = 0.03

t = 5

Step 2 Substitute the known values into the formula.

 $A = Pe^{rt}$

 $A = 2000e^{0.03(5)}$

Step 3 Use a calculator to solve for A, the total amount.

 $A = 2000e^{0.03(5)}$

A ≈ 2323.67 The total amount is \$2323.67. Use the e^x key on a calculator: $2000e^{(.03^*5)} = 2323.668485$

Use the formula $A = Pe^{rt}$ to solve.

7. What is the total amount for an investment of \$500 invested at 4.5% and compounded continuously for 10 years?

500

0.045

10

\$784.16 8. Randy deposited \$1000 into an account that paid 2.8% with continuous compounding. What was her

9. a. Martin borrows \$5500. The rate is set at 6% with continuous compounding. How much does he

\$6201.23

\$1182.94

owe at the end of 2 years? b. Martin found a bank with a better interest rate of 5.5%. How much less does he owe at the end of 2 years?

\$61.70

7-6 Exploring the Number e

John Napier, the inventor of logarithms in 1614, based his work on a number the Swiss mathematician Leonard Euler later called e. The value of *e* is the irrational number 2.71828 . . .

As you have seen, one way to approximate the value of e is to let the value of n become very large in the sequence of numbers obtained from

the expression $1\left(1+\frac{1}{n}\right)^n$. You can explore some other methods for

Consider the sequence $1, \frac{1}{1}, \frac{1}{2 \cdot 1}, \frac{1}{3 \cdot 2 \cdot 1}, \cdots$

- 1. Write the 9th term of the sequence.
- 8 · 7 · 6 · 5 · 4 · 3 · 2 · 1 2.7083

2.718055556

- 2. Using a calculator, determine
 - a. the sum of the first 5 terms of the sequence.
 - b. the sum of the first 7 terms of the sequence.
 - c. the sum of the first 10 terms of the sequence.
- 3. Use what you know about the value of e and the results of Exercise 2 to write an expression for e in terms of the given sequence of numbers.

2.718281526 $e = 1 + \frac{1}{1_1} + \frac{1}{2 \cdot 1}$

denominator is a fraction, and so on, forming a pattern.

A continued fraction is • Example To evaluate, start with the last denominator.

A Continued fraction is formed by a number added to a fraction whose denominator is a fraction whose denominator is a fraction whose added to a fraction whose

Start.

Complete the continued fraction by finding the missing denominator.

Then evaluate.

$$2 + \frac{1}{1 + \frac{1}{2 + \frac{2}{3 + \frac{3}{4 + \frac{4}{3}}}}}$$

$$5. \ 1 + \frac{2}{1 + \frac{1}{6 + \frac{1}{10 + \frac{1}{14 + \frac{1}{1}}}}}$$

$$5 + \frac{5}{6}, \frac{5760}{2119} \approx 2.718263332$$

$$\underline{18+\frac{1}{22},\frac{1,084,483}{398,959}}\approx 2.718281828$$

6. Continue the pattern further in the fractions above and make an observation.

Possible answer: Both of the given continued fractions can be used to determine the value of e.

□ Problem Solving 7-6 The Natural Base, e

Irene reads that the 2004 census of whooping cranes tallied 213 birds at one wildlife refuge in Texas. This number exceeded the 2003 record by 19. If the population of whooping cranes can be modeled using the exponential growth function $P_t = P_0$ the population, P_n at time t can be found, where P_n is the initial population and k is the growth factor. Predict the population of whooping cranes over the next few years.

1. What was the size of the population of whooping cranes in 2003?

2. Use the population figures for 2003 and 2004 to find the growth factor, k.

k = 0.0934

3. Complete the table to predict the population of whooping cranes through 2010.

Year	2006	2007	2008	2009	2010
t	3	4	5	6	7
Population, P_t	257	282	309	340	373

Choose the letter for the best answer.

- 4. Irene wants to know when the population of whooping cranes will exceed 1000. Using the 2003 population as P_0 , which year is the best prediction?
 - A 2017
- **B** 2019
- (C)2021
- D 2023
- 6. How long will it take for an investment in an account paying 6% compounded
- **B** 10.8 years
- A 10.2 years
- continuously to double?
- **C** 11.6 years
- D 12.4 years

Copyright © by Holt, Rinehart and Win All rights reserved.

- 5. Irene wonders how the 2010 whooping crane population would change if the growth factor doubled. Which statement is true?
 - A The population would increase by a factor of e2
 - **B** The population would increase by a factor of e^{0.0934}.
- \bigcirc The population would increase by a factor of $e^{(0.0934)(7)}$.
- D The population would increase by a factor of 7e2
- 7. Darlene has a sample of a fossil that has 33% of its original carbon-14. Carbon-14 has a half-life of 5730 years. The decay
 - constant for carbon-14 is 1.2×10^{-4} . Find the age of the fossil.
 - A About 7820 years B About 8450 years
 - C About 8980 years
- (D) About 9240 years
