

Math Builders

Transformation Builder

Transformations include translations, reflections, and stretches and compressions. This Math Builder shows you how to apply transformations of all types to the quadratic parent function, $f(x) = x^2$.

The clear sheets are the overlays.
The page beneath them is the base.

BASE

Look at the base. It shows the quadratic parent function, $f(x) = x^2$, and its graph.

OVERLAY 1

Drop Overlay 1 onto the base. This overlay shows how to apply translations to the graphs of quadratic functions.

OVERLAY 2

Drop Overlay 2 onto the base. This overlay shows how to apply stretches, compressions, and reflections to the graphs of quadratic functions.

OVERLAY 2: Stretch, Compression, and Reflection

$$h(x) = \left(\frac{1}{2}x\right)^2 - 3$$

Multiply x by $\frac{1}{2}$ to horizontally **stretch** the parabola.

$$h(x) = -\frac{1}{3}(x + 2)^2$$

Multiply by $-\frac{1}{3}$ to vertically **compress** the parabola and **reflect** it across the x -axis.

OVERLAY 1: Translations

$$g(x) = x^2 - 3$$

Subtract 3 from x^2 to **shift**
(or **translate**) the parabola 3
units down.

$$g(x) = (x + 2)^2$$

Add 2 to x to **shift**
(or **translate**) the
parabola 2 units left.

BASE: Quadratic Parent Function

$$f(x) = x^2$$

$$f(x) = x^2$$

Math Builders

Transformation Builder

Transformations include translations, reflections, and stretches and compressions. This Math Builder shows you how to apply transformations of all types to one parent exponential function, $f(x) = 2^x$.

The clear sheets are the overlays.
The page beneath them is the base.

BASE

Look at the base. It shows the exponential parent function $f(x) = 2^x$ and its graph.

OVERLAY 1

Drop Overlay 1 onto the base. This overlay shows how to apply translations to the graphs of exponential functions.

OVERLAY 2

Drop Overlay 2 onto the base. This overlay shows how to apply stretches, compressions, and reflections to the graphs of exponential functions.

OVERLAY 2: Stretch, Compression, and Reflection

$$h(x) = 2^{-3x} + 1$$

Multiply x by -3 to horizontally **compress** the curve and **reflect** it across the y -axis.

$$h(x) = 3 \cdot 2^{(x-2)}$$

Multiply by 3 to vertically **stretch** the curve.

OVERLAY 1: Translations

$$g(x) = 2^x + 1$$

Add 1 to vertically **shift**
(or **translate**) the curve
1 unit up.

$$g(x) = 2^{(x-2)}$$

Subtract 2 from x to **shift**
(or **translate**) the curve 2
units right.

BASE: Exponential Parent Function

$$f(x) = 2^x$$

$$f(x) = 2^x$$
