

LESSON **Reading Strategies**
9-1 **Identify Relationships**

You can represent functions in several ways. You can use an equation, a table, or a graph. Each representation gives the same information.

<p style="text-align: center;">Equation</p> <p style="text-align: center;">$y = 2x$</p> <p style="text-align: center;">When $x = 1$, $y = 2$.</p>	<p style="text-align: center;">Table</p> <table border="1" style="margin: auto; border-collapse: collapse;"> <tr><th style="padding: 5px;">x</th><th style="padding: 5px;">y</th></tr> <tr><td style="padding: 5px;">1</td><td style="padding: 5px;">2</td></tr> <tr><td style="padding: 5px;">4</td><td style="padding: 5px;">8</td></tr> <tr><td style="padding: 5px;">7</td><td style="padding: 5px;">14</td></tr> <tr><td style="padding: 5px;">10</td><td style="padding: 5px;">20</td></tr> </table> <p style="text-align: center;">When $x = 1$, $y = 2$.</p>	x	y	1	2	4	8	7	14	10	20	<p style="text-align: center;">Graph</p>  <p style="text-align: center;">When $x = 1$, $y = 2$.</p>
x	y											
1	2											
4	8											
7	14											
10	20											

Graph L

$y = \frac{x}{3}$

Equation A

Graph M

$y = x^2 + 2x - 5$

Equation B

Graph N

$y = x - 4$

Equation C

x	-4	-1	0	2
y	3	-6	-5	3

Table R

x	6	9	12	15
y	2	3	4	5

Table S

x	-5	-1	2	10
y	-9	-5	-2	6

Table T

Identify the relationships between the graphs, tables, and equations shown above. Explain your reasoning.

- Which table and graph have a relationship with Equation A?

- Which graph and equation have a relationship with Table R?

- Which equation and table have a relationship with Graph M?

LESSON **Reteach**

9-1 Multiple Representations of Functions (continued)

Different representations can be used to solve problems about nonlinear functions.

The table shows the height of a rocket after it is fired. When does the rocket reach its maximum height?

Time (s)	Height (m)
0	30.0
1	47.1
2	54.4
3	51.9
4	39.6
5	17.5

Step 1 Make a scatter plot.

The graph suggests the data are not linear.

Step 2 Check finite differences.

First differences: 17.1 7.3 -2.5 -12.3 -22.1
 Second differences: -9.8 -9.8 -9.8 -9.8

Step 3 Second differences are constant. Use a graphing calculator to find the quadratic regression (QuadReg) equation:
 $y = -4.9x^2 + 22x + 30$.

Step 4 Use TRACE to find the maximum height.

The rocket has a maximum height of about 54.7 m at about 2.2s.

$$y = ax^2 + bx + c$$

$$a = -4.9$$

$$b = 22$$

$$c = 30$$

$$r^2 = 1$$

The table shows the height of a rocket after it is fired. Solve.

- Are the first differences constant? No
- Are the second differences constant? Yes
- Find an equation to model the data.
 $y = -4.9x^2 + 18x + 45$
- When does the rocket reach its maximum height?
About 61.5 m at about 1.9 s

Time (s)	Height (m)
0	45
1	58.1
2	61.4
3	54.9
4	38.6
5	12.5

LESSON **Challenge**

9-1 Find a Function to Fit

Some real-world problems can be modeled using functions. Consider a home owner in Maine faced with deciding which type of heating system to install in a new home. A solar system will cost \$20,000 to install, but the annual heating costs will be \$1000. A geothermal heat pump will cost \$15,000 to install with annual heating costs of \$1500. A conventional oil-fired furnace will cost \$6000 to install with annual heating costs of \$2400.

- Write a function to represent the total cost of each system over t years.
 $f(t) = 20,000 + 1000t$, $g(t) = 15,000 + 1500t$, $h(t) = 6000 + 2400t$

- Graph each function over 20 years.

- If the home owner plans to move within 7 years, which heating system is most economical?
Oil-fired furnace

- Which system is better for a home owner who is planning to live in the house for 30 or more years? How do you know?
Solar system; after 10 years, this system is least expensive.

Consider the graph below. Three functions are shown: a linear function, $f(x)$, a quadratic function, $g(x)$, and a square root function, $h(x)$.

- Identify three points on each graph.
 a. $f(x)$: $(0, 15)$, $(10, 10)$, $(20, 5)$
 b. $g(x)$: $(5, 20)$, $(15, 15)$, $(25, 0)$
 c. $h(x)$: $(-5, 0)$, $(4, 12)$, $(20, 20)$

- Find an equation that models $f(t)$.
 $f(x) = -0.5x + 15$

- Find an equation that models $g(t)$. Remember, every quadratic function is of the form $y = ax^2 + bx + c$. Set up a system of equations and solve for a , b , and c .
 $g(x) = -0.05(x - 5)^2 + 20 = -0.05x^2 + 0.5x + 18.75$

- Find an equation that models $h(t)$. A square root function can be modeled with $y = a\sqrt{x - h} + k$.
 $h(x) = 4\sqrt{x + 5}$

LESSON **Problem Solving**

9-1 Multiple Representations of Functions

Yvonne opened a new video game store. The table shows a record of her sales for the first five weeks. To break even, she needs to sell at least \$12,500 worth of merchandise each week. She assumes the sales trend will continue and wants to know what to expect over the next weeks.

Weekly Store Sales	
Week	Sales (\$)
1	8470
2	8920
3	9360
4	9790
5	10,210

- Graph the data using weeks as the independent variable and sales as the dependent variable.

- Yvonne thinks she can model her sales data using a quadratic function. Is she correct? How do you know?
Yes, because second differences are constant. For a quadratic function, second differences are constant.

- Use a graphing calculator to perform the appropriate regression on the data. Write the equation that models the data.
 $y = -5x^2 + 465x + 8010$

- What sales can Yvonne expect in week 6?
\$10,620
- When will her sales exceed \$11,000 per week?
Week 7
- When will she break even?
Week 11
- When will sales be twice the sales of week 1?
Week 28

Choose the letter for the best answer.

- Which equation represents a steady increase of \$420 per week in sales from week 5 on?
 A $y = -420x + 10,210$
 B $y = 420x + 10,210$
 C $y = -5x^2 + 420x + 10,210$
 D $y = -420x^2 + 10,210x$
- During which week will Yvonne break even if the sales pattern changes and sales in week 6 and week 7 are \$10,640 and \$11,080, respectively?
 F Week 9
 G Week 10
 H Week 11
 J Week 12

LESSON **Reading Strategies**

9-1 Identify Relationships

You can represent functions in several ways. You can use an equation, a table, or a graph. Each representation gives the same information.

<p>Equation</p> $y = 2x$ When $x = 1$, $y = 2$.	<p>Table</p> <table border="1"> <tr><th>x</th><th>y</th></tr> <tr><td>1</td><td>2</td></tr> <tr><td>4</td><td>8</td></tr> <tr><td>7</td><td>14</td></tr> <tr><td>10</td><td>20</td></tr> </table> When $x = 1$, $y = 2$.	x	y	1	2	4	8	7	14	10	20	<p>Graph</p> When $x = 1$, $y = 2$.
x	y											
1	2											
4	8											
7	14											
10	20											

<p>Graph L</p> <p>Equation A</p> $y = \frac{x}{3}$	<p>Graph M</p> <p>Equation B</p> $y = x^2 + 2x - 5$	<p>Graph N</p> <p>Equation C</p> $y = x - 4$	<p>Table R</p> <table border="1"> <tr><th>x</th><th>-4</th><th>-1</th><th>0</th><th>2</th></tr> <tr><th>y</th><td>3</td><td>-6</td><td>-5</td><td>3</td></tr> </table> <p>Table S</p> <table border="1"> <tr><th>x</th><td>6</td><td>9</td><td>12</td><td>15</td></tr> <tr><th>y</th><td>2</td><td>3</td><td>4</td><td>5</td></tr> </table> <p>Table T</p> <table border="1"> <tr><th>x</th><td>-5</td><td>-1</td><td>2</td><td>10</td></tr> <tr><th>y</th><td>-9</td><td>-5</td><td>-2</td><td>6</td></tr> </table>	x	-4	-1	0	2	y	3	-6	-5	3	x	6	9	12	15	y	2	3	4	5	x	-5	-1	2	10	y	-9	-5	-2	6
x	-4	-1	0	2																													
y	3	-6	-5	3																													
x	6	9	12	15																													
y	2	3	4	5																													
x	-5	-1	2	10																													
y	-9	-5	-2	6																													

Identify the relationships between the graphs, tables, and equations shown above. Explain your reasoning.

- Which table and graph have a relationship with Equation A?
Table S and Graph N; possible answer: All the x-values are divided by 3 to get the y-values. The graph is linear and passes through the origin.
- Which graph and equation have a relationship with Table R?
Graph L and Equation B; possible answer: The y-values alternate positive, negative, positive, so it is not linear.
- Which equation and table have a relationship with Graph M?
Equation C and Table T; possible answer: The graph is linear and passes through the point (0, -4). In Table T the y-values are always four less than the x-values.
